

## Website Organization

*Through the process of creating our design docs, we have built up a large amount of documents that have just been floating around for awhile. Module 8 has us organizing these files, and planning for more files in the future.*

At the beginning of this module, I had a ton of files that were all just in the “home” folder for my course page. I had modules 2-6, most of which had multiple files, my .index page, my css page, a bio picture, a header picture, and the README file.

I’m an organization person. I’ve got folders on folder in my computer. My google drive could make you cry. So, from the things that were already in my Github and the things I plan on putting on my portfolio site, I created four main folders and a few subfolders. I made a “modules” folder, because that’s really what’s taking up most of the space on the page right now. Within that folder is a “module6” folder, because six has a lot of components to it. I also created a “pictures” folder to hold things like the bio picture and header, a “contact” folder to hold anything I might need for that page, a “resume” folder to hold my resume and any updates to it that I may need, and finally a “portfolio” folder, with a “pictures,” “writing,” and “video,” subfolder.

I chose these folders because they are intuitive to me. They contain like things and make everything look much more organized. The names aren’t super long but they accurately describe what they are. All of my file names are the same way.
